

How Administrations work!

Working a fly swatter: The fly (1) alights on the honey drop (2) placed on one end of the very sensitive balance (3) thereby leveling the balance so that the pan containing the honey and the fly comes to rest on the stool (4) and consequently the finely pointed end on the opposite side of the balance (5) goes up and pricks the bottom of the Rhesus monkey* (6), who as can be seen, is holding a banana in his left hand, and hence reaches out to explore the source of pain with his right hand thereby releasing the pivoted heavy weight (7), which swings and knocks off the weak support (8), so that the heavy weight (9) falls under the gravity and the far end of the fly swatter (10) is jerked up and the mesh of the swatter comes down hard on the fly supported on the stool.
