

How Administrations work!

The Nail Driver : As the high powered standing committee (1)* enters the room to inspect the novel device, the bar attached to the door (2) swings aside the pole (3) wedged between the hammer (4) and the roof, so that under tension of the stretched spring (5) the hammer starts moving in the direction of the arc (6), thereby pulling on the string (7) which in turn pulls the trigger of the musket (8), so that the nail loaded inside the musket (9) is fired towards point (10) on the opposite wall, snapping enroute the string at the point just in front of the barrel, so that the hammer now completely free of any restraint swings powerfully towards the wall driving the head of the nail fully inside.

* Exhibit (1) is not marked in the picture, since the objects of the exhibit are standing behind the closed door and cannot be seen unless the door is opened.
